Hey Fet,

That Cees is one wild dude, Do you think he is trying sex reversal on the rats,lol.

As you can probably tell I am new to PC,S & this site. I think this site rules, I have learned a hell of a lot in just a week or so, The people here are really mellow. I need to learn the site & how to work it.

I dont know anybody who has used your strains, but after looking at the badass pictures yesterday I will recommend them for sure. I know you are running low on a lot of strains, but can you recommend 1-2 strains 50%SA. 50% in. heavy yield, real potent & about 1 meter 3'4' that you have a good supply left.

Thanks again

Troutmaster

The strong mix I used seems to be working out.

The Afghani at day 37 is slowly producing some pollen. If took 18 days to reverse sex and did not produce a lot of male flowers. I have collected a tiny amount of pollen by tapping on the stems, but the flowers haven't actually dropped or opened much. Hoping for a bit more ...

The Bogglegum at day 14 is doing great. Sex reversal occurred on day 12 after spraying the STS. The Bog also produced male flowers all over the plant in abundance. Looks like it will be a strong producer.

So to sum it up, the mix I have used is as follows:

.5 gram of Silver Nitrate in 200 ml of water

2 grams of Sodium Thiosulfate in 800 ml of water.

NO DILUTION!

A.T.T.T.

Thanks for the info, Yeh it seems the stronger the better. My friend tried full strength on a ww that had a few hairs and now the hairs stopped and it looks like it is trying to change over after 5 days.
